Figure 7.5: Local satisfiability results from the SPASS resolution prover for the test set of target formulae in each of the listed single axioms. The test set of formulae is listed in figure 7.4. C is Completion in SPASS (satisfiable), P is Proof in SPASS (unsatisfiable), and X is ran out of time at 200 seconds execution time. The total execution time for the data in this table is 22.2 hours. The data was extracted from saved output files using a c-shell script, and processed in Microsoft Excel.

*Axiom applied to all the modality indices in the target formula.

Figure 7.9. Local satisfiability results from the SPASS resolution prover for the test set of target formulae in each of the listed axiom combinations: Execution times. The data is taken from the results for test problems 1-119 (see figure 7.4 for details), and is an analysis of the same experiments reported in figures 7.5 to 7.8. Problems are deemed to have failed if they were not solved before running out of time at 200 seconds execution time. Execution time statistics are listed for the solved problems. The statistics for all the problems, regardless of outcome, are all listed under the heading *Total*. This set of solved problems is sub-divided by the outcome, either Completion in SPASS (satisfiable), or Proof in SPASS (unsatisfiable), in the other two sections. Where there is

Mean execution times for local satisfiability over all the problems 1-117 for the various formulations of S5 that were tested are shown below. The formulations that have a strike-through notation are known to be incomplete (since counter-examples were found). The data is sorted by execution time to illustrate the faster formulations. In order to avoid bias, the data *includes* time points for problems that failed to produce a result before the SPASS time out was reached (these are given a 200 seconds execution time; the real execution time must be greater than 200 seconds), and hence the mean execution times are often under-estimates of the true values.

S5 Formulation	Mean execution time (msec)	S5 Formulation	Mean execution time (msec)	S5 Formulation	Mean execution time (msec)

Figure 7.12: Execution times for the eml-translation to first-order logic component of the axiomatic translation for all the examples in this study:

Execution times in SPASS are reported in the output file. These are approximately equal to the CPU execution times plus the disk access times for input/output. The total execution time, and the execution times of various modules are reported (for example, input / translation from EML to FOL / inferences / backtracking / reduction). Over all the test examples, with all unique cases of applied axioms and axiom combinations considered (25642 cases) the execution times for the EML to FOL translation ranges up to a maximum of 1.06 seconds, with the following statistics.

< 0.01 seconds	56.4 %
0.01-0.1 seconds	41 %
0.1-1.06 seconds	2.6 %

Figure 7.13. Comparing execution times of classical and axiomatic schema translations of modal axioms in local satisfiability calculations: The table shows the number of test examples (from the formulae 1-119 in the test set) for which execution times of the local satisfiability calculation in classical translation is, the same as, greater than, and lower than the execution time of the axiomatic schema translation. The data is also subdivided according to whether the outcome of the calculation in SPASS was Proof (unsatisfiable) or Completion (satisfiable). The mean ratios of execution times for axiomatic schema and classical translations are given. The numbers of test cases where formulae were solved in the axiomatic translation, but not in the classical translation, within the cutoff time of 200 seconds, is also reported. Table cells in which there is no data available, either because the calculation ran out of time for the all cases of the classical translation, or in all cases neither calculation produced a result, are empty.

Execution time classical = axiomatic	Execution time classical > axiomatic	Execution time classical < axiomatic	Solved in axiomatic, but not in classical

Figure 7.14: Scott-Lemmon translation (correspondence properties) for selected modal-axioms. The result given is for translation of the formula 5 ($\neg(\rightarrow(\neg\Box\neg\Box p, \Box p))$) in each axiom (using 500 seconds execution time; C = completion (Satisfiable); P = Proof (Unsatisfiable); X = ran out of execution time) in local satisfiability calculations. The SLF-index is the value of the exponents h, i, j, k in $\Box^h\Box^i p \rightarrow \Box^j\Box^k p$. Some of the axioms correspond to well-known modal axioms that are described elsewhere in this study, and are named in the second column. The actual formulae generated by the eml-module are reported.

** Several formulations give rise to the same axiom under the Scott-Lemmon algorithm – for example those marked

Figure 7.21 Global satisfiability results from the SPASS resolution prover for the test set of target formulae in each of the listed axioms. The test set of formulae is seen in figure 7.4. C is Completion in SPASS (satisfiable), P is Proof in SPASS (unsatisfiable), and X is ran out of time at 200 seconds execution time. The total execution time for the data in this table is 2.2 hours.

Figure 7.25 Global satisfiability results from the SPASS resolution prover for the test set of target formulae in each of the listed axiom combinations. The data is taken from the results for test problems 1-119. Problems are deemed to have failed if they were not solved before running out of time at 200 seconds execution time. Execution time statistics are listed for the solved problems. The statistics for all the problems, regardless of outcome, are all listed under the heading *Total*. This set of solved problems is sub-divided by the outcome, either Completion in SPASS (satisfiable), or Proof in SPASS (unsatisfiable), in the other two sections. Where there is no data (no problems solved) the table is blank. The median, arithmetic mean ± standard deviation, and maximum values are recorded.

Axiom	Total set of problems				Problem outcome = Proof				Problem outcome = Completion			
	No. problems solved (failed)	Execution time in msec			No. problems solved	Execution time in msec			No. problems solved	Execution time in msec		
		Median	Mean ±SD	Max		Median	Mean ±SD	Max		Median	Mean ±SD	Max
